This is a Good project. You have built a system that conducts sentiment analysis of images according to the project brief. You have provided a user guide and a more technical explanation of the project. You have also included your conclusions and suggestions for the future. You have addressed the project scenario. You used DeepFace, for your emotion detection system. Your final submission includes document that explains the project and ties all the other documents together. Your system included and CLI interface which I think users will find hard to use.
